The logs *nobody reads.*

FOUR CHECKS THAT TURN LOGS INTO WARNINGS

Most companies have logs. **Far fewer have anyone reading them.**

The evidence is *often sitting there.*

Most companies have logs. Far fewer have anyone reading them.

After an incident, the evidence is often sitting there, recorded weeks earlier and never looked at.

01

Pick the events *that matter.*

Failed logins in bursts, admin role changes, bulk exports, new API keys. Not everything.

02

Alert on those.
Send alerts to a person.

Not a shared inbox nobody owns.

MICHAEL ADEYANJU

SWIPE →

03

Keep logs where *an attacker can't delete them.*

For long enough to investigate. Months, not days.

04

Test it.
On purpose.

Trigger one of those events on purpose and time how long it takes someone to notice.

A log nobody reads *is a record of what you missed.*

When did someone last notice something because of an alert?

TELL ME IN THE COMMENTS
